

Measurement Methods

Define Measurement Methods Overview

You can manage the Measurement Methods in **DEFINE MODEL > Set Measurement Options > Measurement Methods** page:

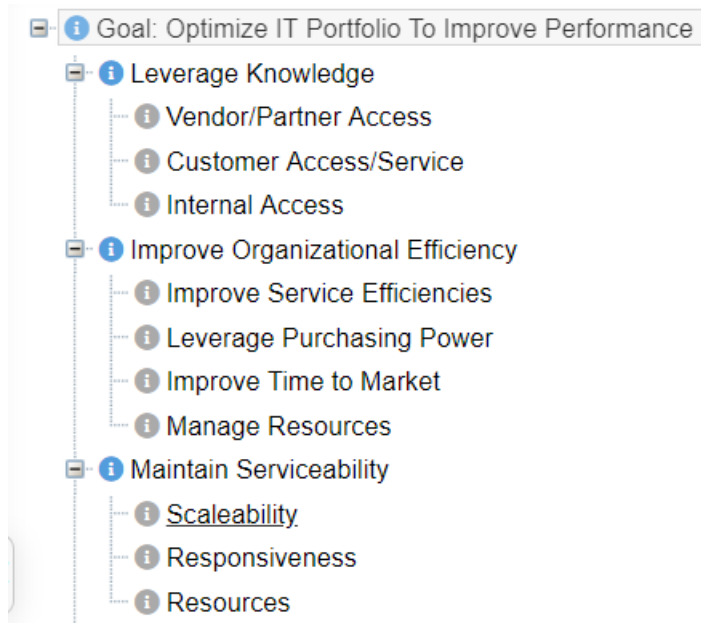

The Measurement Methods page is used to designate how priorities are to be derived or assigned:

1. **For objectives** with respect to their **parent objective**
2. **For alternatives** with respect to the **covering objectives**

Depending on the selected option, you can define both the objectives and alternatives measurement methods on the same page or separately:

All For Objectives For Alternatives

For example, in the model whose objectives hierarchy is shown below:

Vendor/Partner Access, Customer Access/Service, and Internal Access are covering objectives.

When the **For Objectives** option is selected, we define how the objectives will be measured with respect to their parent.

Measure Objectives With Respect To	Measurement Type	Special designations / Action
Goal: Optimize IT Portfolio To Improve Performance	Pairwise Comparisons ▼	
<ul style="list-style-type: none"> — Leverage Knowledge <ul style="list-style-type: none"> — Vendor/Partner Access — Customer Access/Service — Internal Access — Improve Organizational Efficiency <ul style="list-style-type: none"> — Improve Service Efficiencies — Leverage Purchasing Power — Improve Time to Market — Manage Resources 	Pairwise Comparisons ▼	
	Pairwise Comparisons ▼	

For objectives, we can select either **Pairwise Comparisons** or **Direct entry**

When the **For Alternatives** option is selected, we define how the alternatives are measured with respect to the covering objectives.

Measure Alternatives With Respect To	Measurement Type Default: Rating Scale	Measurement Scale	Special designations / Action
Goal: Optimize IT Portfolio To Improve Performance			
<ul style="list-style-type: none"> — Leverage Knowledge <ul style="list-style-type: none"> — Vendor/Partner Access — Customer Access/Service — Internal Access — Improve Organizational Efficiency <ul style="list-style-type: none"> — Improve Service Efficiencies — Leverage Purchasing Power — Improve Time to Market — Manage Resources 	Rating Scale ▼	Scale for Vendor/Partn ▼	
	Rating Scale ▼	Scale for Customer Ac ▼	
	Rating Scale ▼	Scale for Internal Acce ▼	
	Rating Scale ▼	Scale for Improve Serv ▼	
	Rating Scale ▼	Scale for Leverage PuI ▼	
	Rating Scale ▼	Scale for Improve Time ▼	
	Rating Scale ▼	Scale for Manage Resi ▼	

For alternatives, we can select the following methods:

When **All** is selected, we can define both the Objectives and Alternatives methods at the same time:

Measure Objectives/Alternatives With Respect To	Measurement Type Default (A): Rating Scale	Measurement Scale	Special designations / Action
Goal: Optimize IT Portfolio To Improve Performance	Pairwise Comparisons ▼		
Leverage Knowledge	Pairwise Comparisons ▼		
Vendor/Partner Access	Rating Scale ▼	Scale for Vendor/Partn ▼	
Customer Access/Service	Rating Scale ▼	Scale for Customer Ac ▼	
Internal Access	Rating Scale ▼	Scale for Internal Acce ▼	
Improve Organizational Efficiency	Pairwise Comparisons ▼		
Improve Service Efficiencies	Rating Scale ▼	Scale for Improve Serv ▼	
Leverage Purchasing Power	Rating Scale ▼	Scale for Leverage Pu ▼	
Improve Time to Market	Rating Scale ▼	Scale for Improve Time ▼	
Manage Resources	Rating Scale ▼	Scale for Manage Resi ▼	

Measurement Methods for Evaluating Objectives

Measurement Methods for evaluating objectives can be found on **DEFINE MODEL > Set Measurement Options > Measurement Methods > For Objectives** radio button is where we designate how priorities are to be derived or assigned with respect to those objectives (elements) in the objectives hierarchy that have elements below them.

- All
 For Objectives
 For Alternatives

NOTE: You can also define Measurement Methods for Objectives in **All** mode (measurement methods options For Objectives and For Alternatives options are available).

The default measurement method for each cluster in the objectives hierarchy is pairwise as can be seen below.

Measure Objectives With Respect To	Measurement Type	Special designations / Action
Goal: Optimize IT Portfolio To Improve Performance └─ Leverage Knowledge ├─ Vendor/Partner Access ├─ Customer Access/Service └─ Internal Access └─ Improve Organizational Efficiency ├─ Improve Service Efficiencies ├─ Leverage Purchasing Power ├─ Improve Time to Market └─ Manage Resources	Pairwise Comparisons ▾ Pairwise Comparisons ▾ Pairwise Comparisons ▾	[Icon] [Icon] [Icon] [Icon] [Icon] [Icon]

Pairwise comparisons are used to derive ratio scale priorities for the relative importance of objectives, possibly sub-objectives, sub-sub objectives... in the objectives hierarchy. (In some decisions, other types of elements such as scenarios or constituencies may be in the hierarchy. Priorities representing the relative likelihood of different scenarios, or the relative importance of different constituencies, are derived in the same manner.)

The pairwise comparisons can be made **verbally, numerically, or graphically**.

It is also possible to assign priorities **directly** to objectives instead of making pairwise comparisons. This is not generally recommended but can be useful if priorities have been derived in another model or specified by a process such as an RFP.

Enabling the **Advanced Mode** switch at the bottom of the page will show **additional information and options per cluster**.

Measurement Methods for Evaluating Alternatives

The same pairwise comparison technique used for measuring the priorities of the objectives can be used to measure the priorities representing the relative preference of alternatives with respect to each lowest level objective (also called covering objective or terminal objective).

However, if a large number of alternatives are being prioritized (possibly hundreds or thousands), there would be an inordinate number of pairwise comparisons if all possible pairs were evaluated. There are two practical approaches that can be taken:

- Make pairwise comparisons on a subset or subsets of all possible pairs.
- Define and apply absolute measurement scales.

The most common approach and the one described here is to use absolute measurement.

There are **three types of absolute measurement scales** in Expert Choice.

1. Rating scales
2. Step functions
3. Utility curves

When there are many alternatives to score, rating scales are an effective way to elicit judgments from participants. Priorities for rating scale intensities are derived using pairwise comparison by the project manager and team prior to scoring alternatives. Rating scales are appropriate for qualitative judgments or qualitative facts about alternatives.

Step functions and utility curves are appropriate for ingesting quantitative data and converting into ratio scale measures. Priorities for step function or utility curve data are derived using pairwise comparison by the project manager and team prior to scoring alternatives.

Specifying Measurement Type and Measurement Scale for Evaluating Alternatives with Respect to Covering Objectives

Use the measurement methods page to maintain measurement methods and to assign measurement methods to covering objectives. Use the drop-down menu in the “Measurement type” column of each covering objective to specify the measurement type for each covering objective. Use the drop-down menu in the “Measurement scale” column of each covering objective to specify the desired scale from the drop-down menu. To create a new measurement method, choose “create new” from the drop-down in the “Measurement scale” column. Click the pencil in the Actions column to edit the measurement scale.

Alternatively, use the Manage Scales button, to maintain all measurement scales in one place. After that, select the measurement method and measurement scale for each covering objective in the “Measurement scale” column, as explained above. A single measurement scale can be assigned to multiple covering objectives.

MANAGE MODELS DEFINE MODEL COLLECT INPUT SYNTHESIZE ALLOCATE REPORTS			
<input type="radio"/> For Objectives <input checked="" type="radio"/> For Alternatives <input type="radio"/> All			
Manage Scales			
Measure Alternatives With Respect To	Measurement Type Default: Pairwise Comparisons	Measurement Scale	Action
Goal: Optimize IT Portfolio To Improve Performance			
— Leverage Knowledge			
— Vendor/Partner Access	Rating Scale [v] ↻	Scale for Vendor/Partr [v]	[Copy] [Link]
— Customer Access/Service	Rating Scale [v] ↻	Scale for Customer Ac [v]	[Copy] [Link]
— Internal Access	Rating Scale [v] ↻	Scale for Internal Acce [v]	[Copy] [Link]
— Improve Organizational Efficiency			
— Improve Service Efficiencies	Rating Scale [v] ↻	Scale for Improve Sen [v]	[Copy] [Link]
— Leverage Purchasing Power	Rating Scale [v] ↻	Scale for Leverage Pu [v]	[Copy] [Link]
— Improve Time to Market	Rating Scale [v] ↻	Scale for Improve Tim [v]	[Copy] [Link]
— Manage Resources	Rating Scale [v] ↻	Scale for Manage Res [v]	[Copy] [Link]
— Maintain Serviceability			
— Scalability	Rating Scale [v] ↻	Scale for Scalability [v]	[Copy] [Link]

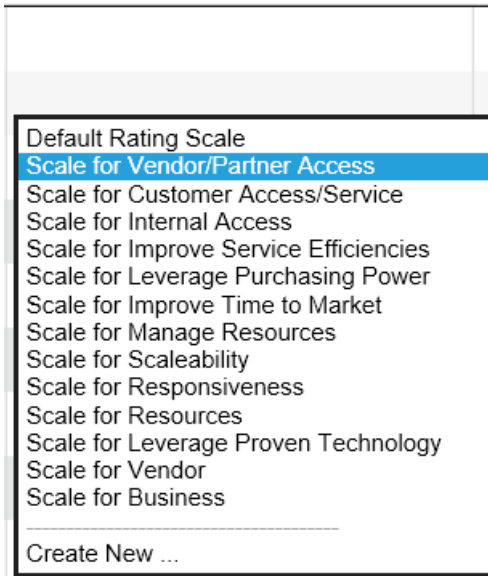

The Measurement Type is set by selecting from the drop-down menu under Measurement type:

Measurement Type
Default: Pairwise Comparisons

With the exception of pairwise comparisons, you also specify a measurement scale (either an existing one or create a new one) for the selected measurement type. The Measurement Scale is set by selecting from the Measurement Scale drop-down:

Measurement Scale

From our example above, alternatives with respect to Vendor/Partner Access are to be evaluated with the "Rating Scale" measurement type using "Scale for Vendor/Partner Access."

Clicking the  icon will open the evaluation page specific to the cluster:

In the example above, clicking the eye icon for the Vendor/Partner Access will redirect you to the first evaluation step for evaluating the alternative(s) with respect to the Vendor/Partner Access.

Manage Measurement Scales for Alternatives

You can manage (create, edit, delete, clone, etc.) the measurement scales of the model using the

[Manage Scales](#)

button.

Clicking the **Manage Scales** button will open a dialog box as below:

Manage Scales

The existing scale(s) of the selected Measurement Method are populated in the Measurement Scale drop-down.

Comparison provides at least one "default" scale for each rating type, and unless you have already defined additional scales specific to your application, you may have the choice of only one default scale for each measurement type. Although it is more time-consuming, it is also more accurate and we recommend creating scales specific to the evaluation being performed.

Measurement Method: Rating Scale ▼

Measurement Scale: Default Rating Scale

Scale Name: Scale for Vendor/Partner Access

Description: Scale for Customer Access/Service

Hide Priorities and direct entry during evaluation

Intensity Name	Priority	Description	Actions
Outstanding			
Excellent			
Very Good			

Measurement scale settings/options vary depending on the Measurement Type (Rating scale, Step Function, Utility curve).

You can specify, create, and edit measurement scales for covering objectives. Use the drop-downs to set measurement type and measurement scale for each covering objective (either an existing scale or "New" to create a new scale).

Measure Alternatives With Respect To	Measurement Type Default: Rating Scale	Measurement Scale	Action
Goal: Optimize IT Portfolio To Improve Performance			
— Leverage Knowledge			
— Vendor/Partner Access	Rating Scale <input type="button" value="v"/>	Scale for Vendor/Partr <input type="button" value="v"/>	<input type="button" value="Copy"/> <input type="button" value="eye"/> <input type="button" value="edit"/>
— Customer Access/Service	Rating Scale <input type="button" value="v"/>	Scale for Customer Ac <input type="button" value="v"/>	<input type="button" value="Copy"/> <input type="button" value="eye"/> <input type="button" value="edit"/>
— Internal Access	Rating Scale <input type="button" value="v"/>	Scale for Internal Acce <input type="button" value="v"/>	<input type="button" value="Copy"/> <input type="button" value="eye"/> <input type="button" value="edit"/>

From above, the covering objectives are assigned with Rating Measurement Type with a specific scale for each.

Clicking the Measurement Scale drop-down on one covering objective will list all the Rating Scales available in the model. You can click "Create New ..." if you want to create a new one and assign it to that covering objective.

Measure Alternatives With Respect To	Measurement Type Default: Rating Scale	Measurement Scale	Action
Goal: Optimize IT Portfolio To Improve Performance			
— Leverage Knowledge			
— Vendor/Partner Access	Rating Scale <input type="button" value="v"/>	<div style="border: 1px solid black; padding: 5px;"> Default Rating Scale Scale for Vendor/Partner Access Scale for Customer Access/Service Scale for Internal Access Scale for Improve Service Efficiencies Scale for Leverage Purchasing Power Scale for Improve Time to Market Scale for Manage Resources Scale for Scaleability Scale for Responsiveness Scale for Resources Scale for Leverage Proven Technology Scale for Vendor Scale for Business Create New ... </div>	<input type="button" value="eye"/> <input type="button" value="edit"/>
— Customer Access/Service	Rating Scale <input type="button" value="v"/>		<input type="button" value="eye"/> <input type="button" value="edit"/>
— Internal Access	Rating Scale <input type="button" value="v"/>		<input type="button" value="eye"/> <input type="button" value="edit"/>
— Improve Organizational Efficiency			
— Improve Service Efficiencies	Rating Scale <input type="button" value="v"/>		<input type="button" value="eye"/> <input type="button" value="edit"/>
— Leverage Purchasing Power	Rating Scale <input type="button" value="v"/>		<input type="button" value="eye"/> <input type="button" value="edit"/>
— Improve Time to Market	Rating Scale <input type="button" value="v"/>		<input type="button" value="eye"/> <input type="button" value="edit"/>

You can also edit the measurement scale currently selected on the drop-down by clicking the  button.

The parameters needed to define a measurement scale vary according to Measurement Method (rating scale, step function, or utility curve).

NOTE: If you edit the priorities or shapes of utility curves for any scales after some or all evaluations are performed, the new priorities will be applied to the existing evaluations.

However, if you choose a new scale or modify an existing scale by adding or removing intensities, any prior evaluations will need to be redone. You can also click the button in the grid to edit a specific scale selected in the row.

Rating Scales

Rating scales can be created and modified by specifying Intensities (words) and corresponding priorities. It is recommended that the rating scales contain more than just three or four intensities and that the priorities be derived, rather than arbitrarily assigned.

Add Intensity

Copy to clipboard Paste from clipboard Assess priorities Close

Copy / Paste Scale

Click Copy to clipboard to copy the intensity names, priorities, and descriptions to the clipboard which you can paste to another scale of the same or another model.

You can paste intensities from the clipboard using the Paste from clipboard . Scale to be pasted should be in this format:

Scale Name

Intensity NamePriorityDescription

e.g:

My Default Scale
 Excellent 1 (the alternative has excellent performance)
 Very Good 0.5
 Very Poor 0.1

Note: The Scale Name and Intensity Description are optional.

Clone Scale

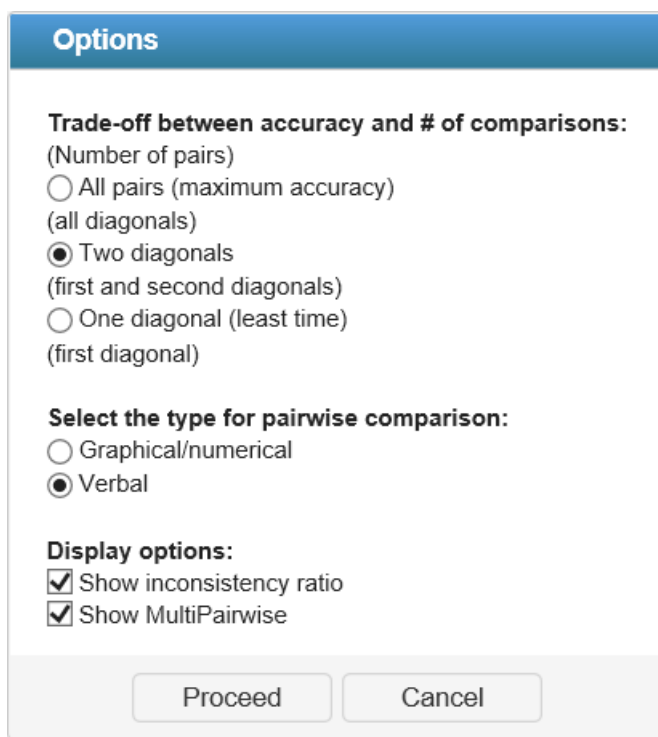

Click Clone to create an exact copy of a rating, step function, or utility curve scale. This includes all the scale details as well as the judgments made to derive the priorities (if any).

Deriving Rating Scale Priorities

For example, we will create a new rating scale with the following intensities:

- Very High
- High
- Average
- Low
- Very Low
- None

Clicking the **Assess priorities** button will open a window where you can select the option settings for assessing the intensities:

The screenshot shows a dialog box titled "Options" with a blue header. It contains three sections of settings:

- Trade-off between accuracy and # of comparisons:**
(Number of pairs)
 All pairs (maximum accuracy)
(all diagonals)
 Two diagonals
(first and second diagonals)
 One diagonal (least time)
(first diagonal)
- Select the type for pairwise comparison:**
 Graphical/numerical
 Verbal
- Display options:**
 Show inconsistency ratio
 Show MultiPairwise

At the bottom of the dialog box are two buttons: "Proceed" and "Cancel".

Click Proceed.

Another dialog box will be displayed where you can select which of the intensities will be excluded in the assessment. Excluded intensities will get a zero priority.

Confirmation

Check any intensity that should have a priority of zero:

- Excellent
- Very Good
- Good
- Marginal
- Poor
- None

From above, we excluded the intensity "None."

Clicking the OK button will open the evaluation page where you can do the assessments as shown below:

Assess priorities

With respect to: **Scale for Vendor/Partner Access**, evaluate the *relative preference* of the two intensities in each pair below.

Scale for Vendor/Partner Access

	Ex	VS	S	M	Eq	M	S	VS	Ex	
Excellent										Very Good
Very Good										Good
Good										Marginal
Marginal										Poor
Excellent										Good
Very Good										Marginal
Good										Poor

Ex	Extremely — an order of magnitude (10 to 1) or more
VS	Very strongly
S	Strongly
M	Moderately
Eq	Equal

The derived priorities are normalized so that the maximum is 1 as shown above.

Step Functions

Step functions are similar to rating scales in that they contain verbal intensities and priorities, but they are more similar

to Utility curves which translate data into priorities.

Manage Scales

Measurement Method: Use as default

Measurement Scale:

Scale Name: **Step Function Scale**

Description:

Piecewise Linear

Name	Lower bound data	Priority	Actions
A	100	1.00000	<input type="text"/> <input type="text"/>
B	75	0.50000	<input type="text"/> <input type="text"/>
C	50	0.25000	<input type="text"/> <input type="text"/>
D	25	0.09000	<input type="text"/> <input type="text"/>
E	10	0.00000	<input type="text"/> <input type="text"/>

By default, the Piecewise Linear option is enabled. Disabling this will produce the data-priority graph as shown below:

Manage Scales

Measurement Method: Use as default

Measurement Scale:

Scale Name: **Step Function Scale**

Description:

Piecewise Linear

Name	Lower bound data	Priority	Actions
A	100	1.00000	<input type="text"/> <input type="text"/>
B	75	0.50000	<input type="text"/> <input type="text"/>
C	50	0.25000	<input type="text"/> <input type="text"/>
D	25	0.09000	<input type="text"/> <input type="text"/>
E	10	0.00000	<input type="text"/> <input type="text"/>

You can also derive the Step function priorities the same way when Deriving the Rating Scale Priorities.

Utility Curves

Utility curves translate data into priorities.

Utility curves can be increasing or decreasing, linear, or non-linear.

You can set the lower and upper limits of utility curves, which by default are 0 and 1.

Manage Scales

Measurement Method: Use as default

Measurement Scale:

Scale Name: **Utility Curve Scale**

Description:

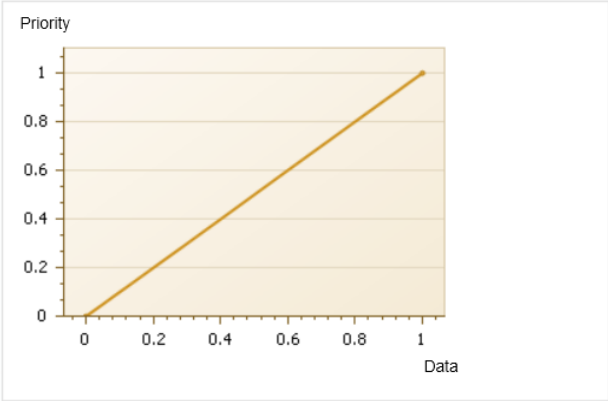

Low:

High:

Increasing Linear

Decreasing Nonlinear

Curvature:

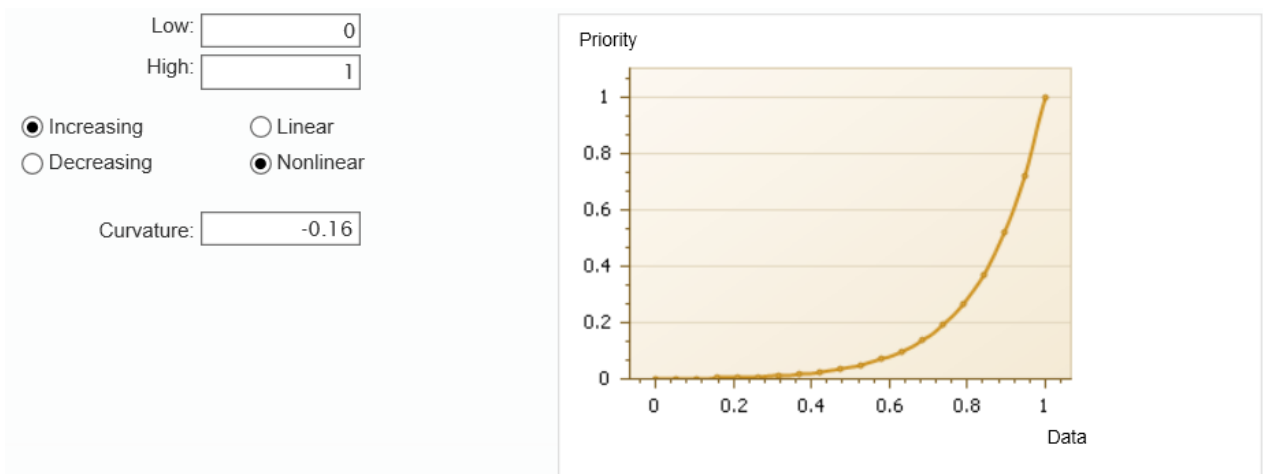

The lower limit on the x-axis of the utility curve can be negative to accommodate negative data. Ratio scale priorities (y values), however, are always positive. Some care should be exercised in selecting the x value representing 0 priority because an arbitrary shifting of a utility curve will destroy the ratio scale property of the resulting priorities.

Curvature:

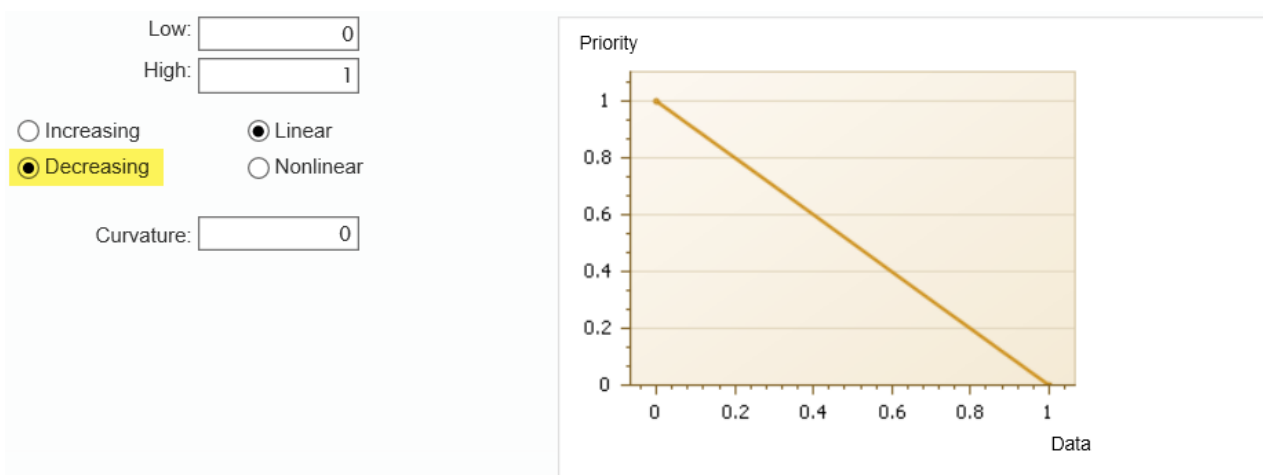

Increasing the value in the curvature specification will introduce more curvature and a concave utility curve:

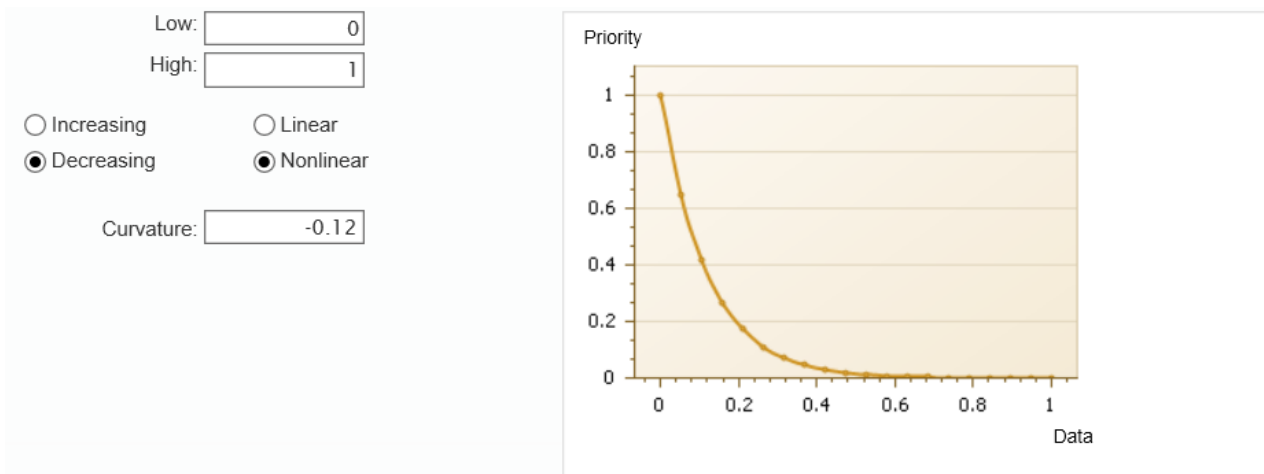

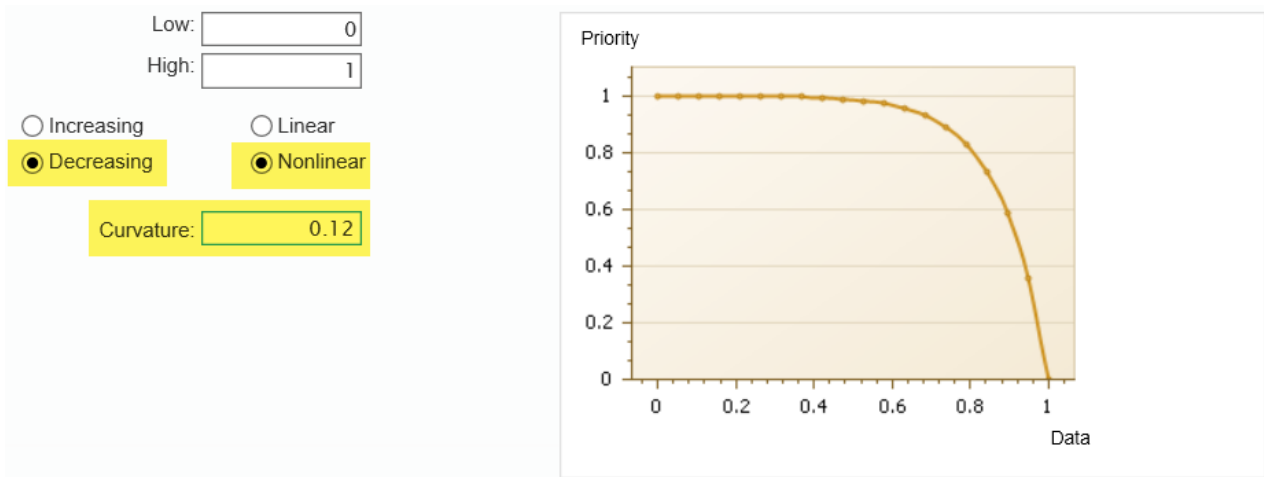

Decreasing the value in the curvature specification to negative values will produce a convex utility curve:

For decreasing utility curves, data that is below the lower limit will translate to priorities of 1, and data to the right of the upper limit will translate to priorities of 0. Data between the lower and upper limit will translate to priorities as specified by the utility curve:

Concave and Convex decreasing utility curves can be established by increasing or decreasing the curvature specification above or below zero in a similar fashion as for the increasing utility curves:

Enabling the Advanced Mode switch at the bottom of the page will show additional information and options per cluster:

The **# of Elements** column displays the number of alternatives that are contributing to a given cluster.

The **# of Judgments** for non-pairwise measurement methods is simply equal to the # of elements.

Advanced Mode: Define Pairwise Comparisons Options per Cluster

When defining the **Measurement Methods**, additional information and options can be displayed when **Advanced Mode** is ON.

Measure Objectives With Respect To	Measurement Type	Special designations / Action	# Of Elements In Cluster	# Of Judgments In Cluster Total: 22	# Of Comparisons Default: Two diagonals	Display Default: One pair	Pairwise Type Default: Verbal	Force Graphical Default: Yes
Goal: Optimize IT Portfolio To Improve Performance	Pairwise Comparisons		5	$(5-1)+(5-2) = 7$	Two diagonals (first an	One pair	Verbal	<input checked="" type="checkbox"/>
Leverage Knowledge	Pairwise Comparisons		3	$3*(3-1)/2 = 3$	All pairs (maximum	One pair	Verbal	<input checked="" type="checkbox"/>
Vendor/Partner Access								
Customer Access/Service								
Internal Access								
Improve Organizational Efficiency	Pairwise Comparisons		4	$4*(4-1)/2 = 6$	All pairs (maximum	One pair	Verbal	<input checked="" type="checkbox"/>
Improve Service Efficiencies								
Leverage Purchasing Power								
Improve Time to Market								
Manage Resources								

Options per cluster for ALL measurement types:

The **# of Elements in cluster** column displays the number of sub-objectives of the given objective (parent).

The **# of Judgments in Cluster** shows the total number of judgments required on a given cluster (*ignoring roles*). For pairwise comparisons, the number of judgments depends on the number of elements and the number of comparisons (diagonals) specified. For non-pairwise comparisons, the number of judgments is equal to the number of elements.

Hovering on the cell will display the formula used:

# Of Judgments In Cluster Total: 22	
$(5-1)+(5-2) = 7$	
3	$(nc-1)+(nc-2)$, where nc = number of children

Options per cluster for Pairwise Comparisons

You can define the options for Pairwise Comparisons (*No. of diagonals, Display, Pairwise Type, Force Graphical*) when evaluating the **objectives with respect to its parent**, or **alternatives with respect to the covering objectives** in Judgments Options page which determine the default options for each cluster.

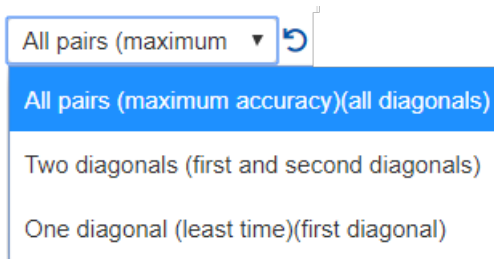

When the Auto-advance option is ON, you have additional control over these options by assigning them per **cluster**. These help you to better balance rigor and accuracy with the time and energy required to evaluate the various steps.

In the example below, for "Goal: Optimize IT Portfolio Optimization" we keep the number of comparisons Two Diagonals (as defined in Judgments Options page), but for the "Leverage Knowledge" and "Improve Organizational Efficiency" clusters, we specify to evaluate all the possible pairs (All pairs).

Expert Choice Comparison® Help Document

Measure Objectives With Respect To	Measurement Type	Special designations / Action	# Of Elements In Cluster	# Of Judgments In Cluster Total: 22	# Of Comparisons Default: Two diagonals	Display Default: One pair	Pairwise Type Default: Verbal	Force Graphical Default: Yes
Goal: Optimize IT Portfolio To Improve Performance	Pairwise Comparisons		5	$(5-1)+(5-2) = 7$	Two diagonals (first an	One pair	Verbal	<input checked="" type="checkbox"/>
Leverage Knowledge	Pairwise Comparisons		3	$3*(3-1)/2 = 3$	All pairs (maximum	One pair	Verbal	<input checked="" type="checkbox"/>
Vendor/Partner Access								
Customer Access/Service								
Internal Access								
Improve Organizational Efficiency	Pairwise Comparisons		4	$4*(4-1)/2 = 6$	All pairs (maximum	One pair	Verbal	<input checked="" type="checkbox"/>
Improve Service Efficiencies								
Leverage Purchasing Power								
Improve Time to Market								
Manage Resources								

The # of Comparisons can be All pairs, two diagonals, or one diagonal.

The most accurate results are achieved with the first option above but at the expense of taking more time. If the number of elements in a cluster is small, then this option provides the most redundancy and hence the most accurate results.

The choice of first and second diagonals in the above example would entail 4+3 judgments. This would consist of 3 "redundant" judgments (since at least 4 judgments are required for a spanning set) and would be reasonable even if verbal judgments were made.

Choosing the minimum number of comparisons is not recommended unless pairwise graphical judgments are made and you have confidence in the accuracy of each of the judgments.

The **Display** column defines the number of pairs to display during the evaluation -- whether to compare one pair at a time or display all pairs at once:

The **Pairwise type** can be Graphical/Numerical or Verbal:

Graphical judgments, being ratio scale measures to begin with, generally produce more accurate results and require less redundancy to produce accurate results than do verbal judgments.
