October 2, 2025

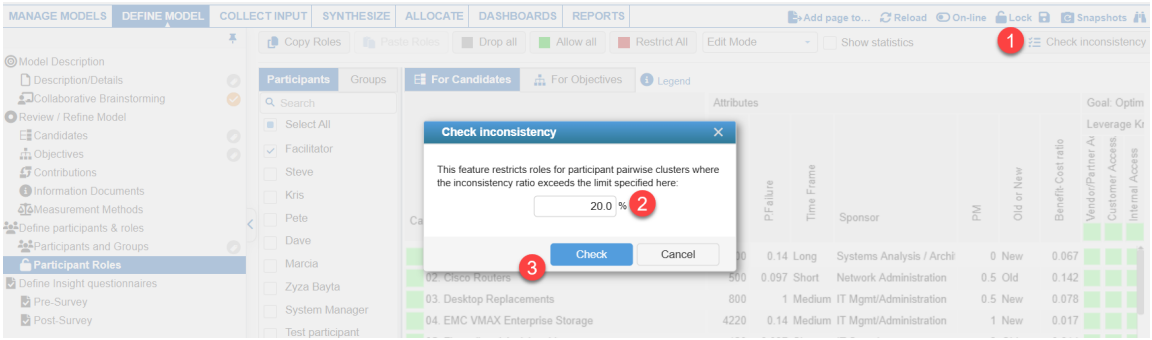

October 2, 2025 | Version 6.19.4.10020834 (Build 20251002.3)

Enhancements

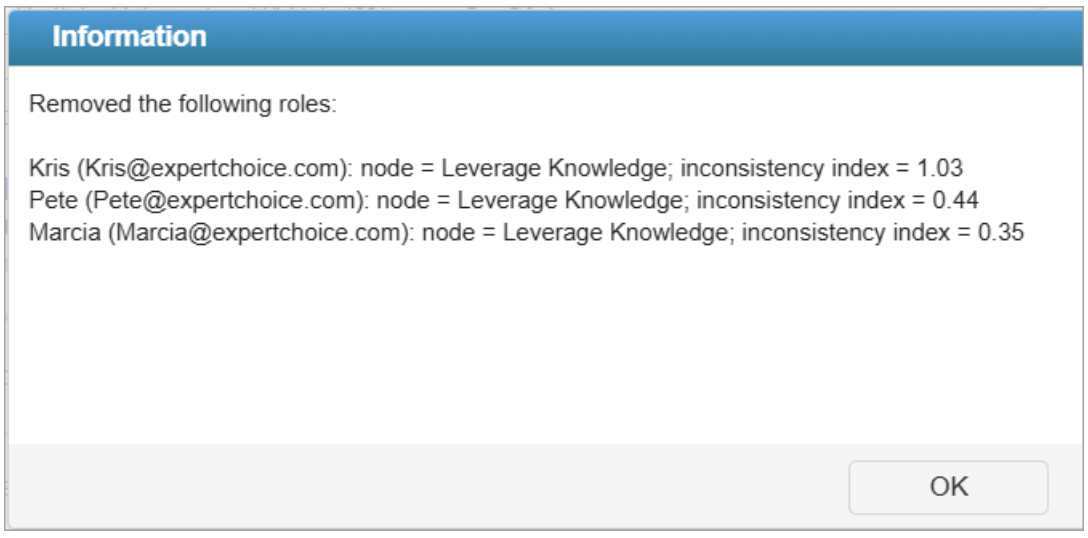

- An option has been added to check the **inconsistency ratio** and assign a **restricted evaluation role**. By default, this option is hidden and can be enabled in the **Collect Input > Set Measurement Options** page.

When the above option is enabled, the **(1)**  button is displayed in the **Participants Role** page. Clicking this opens a dialog where you can set the **(2)** inconsistency ratio (by default: 20%).

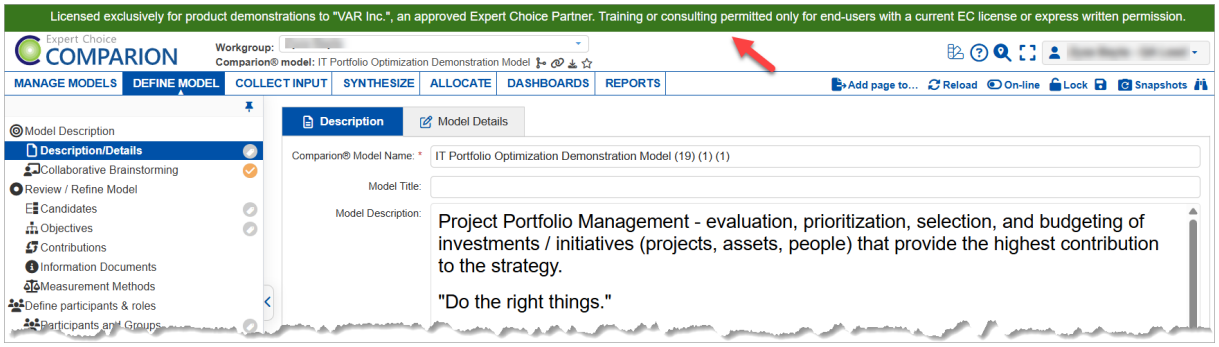

Clicking the **(3)** Check button will display the results. The participants whose inconsistency ratio exceeds the specified limit will be automatically assigned a restricted role within the corresponding clusters.

- A new option has been added to display a **watermark** within your workgroup. This feature can be enabled by the **site administrator** and is intended to support branding, confidentiality, or identification needs across shared views.

- **Active Sorting** for Dynamic Sensitivity is now enabled by default. This ensures that alternative results are automatically sorted as the objective priorities are temporarily changed.

Bug Fixes

- Allocate:
  - Fixed the calculation in the Efficient Frontier page when Risk constraints are used. The Expected Benefits (Benefit * Risk) is now correctly used instead of raw Benefits.
  - Updated the column label from *Benefit-Cost Ratio* to *E. Benefit-Cost Ratio* when Risks are used, and corrected the associated calculation.
  - Resolved inconsistent font styles in the *E. Benefit* and *Risk* columns
- Fixed the issue when incorrect information documents were being displayed during multi-evaluation using the magnifying glass icon.
- Addressed the error triggered when uploading images that exceed the size limit.
- Fixed the *resource not parsed* error message that appeared under certain license limitations.
- Long objective names are now truncated in the TeamTime Overall Results page to prevent layout issues.
- Corrected rounding errors in evaluation outputs.
- Fixed a model-dependent error affecting dashboard rendering.
