

# September 2025

## Enhancements

- An option has been added to check the **inconsistency ratio** and assign a **restricted evaluation role**. By default, this option is hidden and can be enabled in the **Collect Input > Set Measurement Options** page.

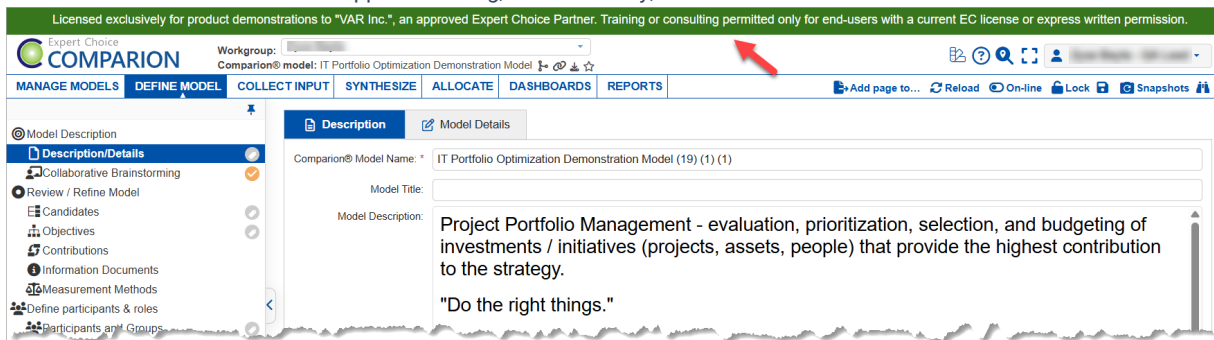

When the above option is enabled, the **Check inconsistency** button is displayed in the **Participants Role** page. Clicking this opens a dialog where you can set the inconsistency ratio (by default: 20%)

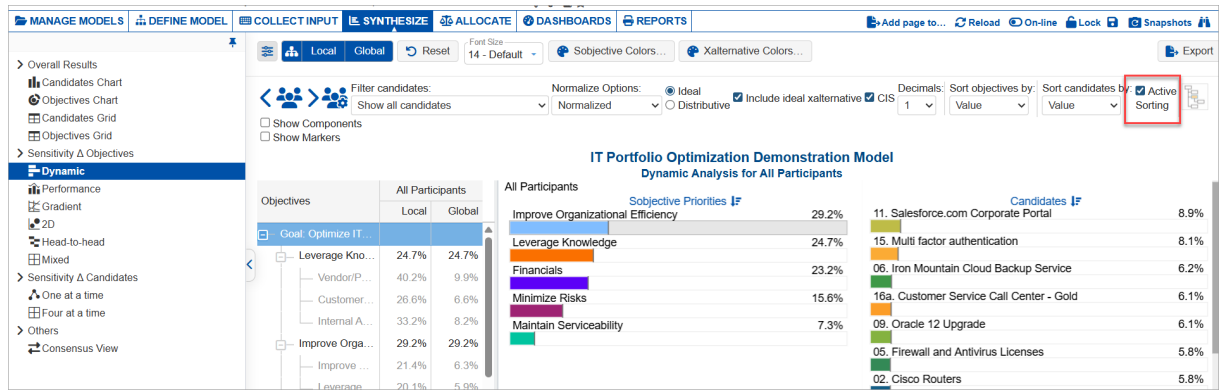

Any participant whose inconsistency ratio exceeds the specified limit will be automatically assigned a restricted role within the corresponding clusters.

- A new option has been added to display a **watermark** within your workgroup. This feature can be enabled by the **site administrator** and is intended to support branding, confidentiality, or identification needs across shared views.

- Active Sorting** for Dynamic Sensitivity is now enabled by default. This ensures that objective results are automatically sorted based on priorities.

## Bug Fixes

- Allocate:
  - Fixed the calculation in the Efficient Frontier page when Risk constraints are used. The Expected Benefit is now correctly used instead of raw Benefits.
  - Updated the column label from *Benefit-Cost Ratio* to *E. Benefit-Cost Ratio* when Risks are used, and corrected the associated calculation.
  - Resolved inconsistent font styles in the *E. Benefit* and *Risk* columns
- Fixed the issue when incorrect information documents were being displayed during multi-evaluation.
- Addressed the error triggered when uploading images that exceed the size limit.
- Fixed the *resource not parsed* error message that appeared under license constraints.
- Long objective names are now truncated in the TeamTime Overall Results page to prevent layout issues.
- Corrected rounding errors in evaluation outputs.
- Fixed a model-dependent error affecting dashboard rendering.
